CODEN: CMATEX; ISSN: 0897-4756

PUBLISHER: American Chemical Society

DOCUMENT TYPE: Journal

LANGUAGE: English

AB A novel self-assembling mol. with coplanar anthraquinonyl and anthryl moieties linked by an acetylenic unit has been designed and synthesized as an electron acceptor for efficient photocurrent generation. The high-resolution scanning tunneling microscopy (STM) images showed that the **self-assembled monolayer** (SAM) of this mol. forms highly ordered two-dimensional (2D) arrays on Au(111) with an oblique lattice and graphite-like stacking at room temperature. The electrochem.

study of this mol. and its SAM on Au showed reversible characteristics. The SAMs generated by co-assembling this acceptor with an oligo(pyrrolothiophene) donor show very promising photoelectrochem. properties. The amount of photocurrent generated (up to 1425 nA/cm<sup>2</sup>, 23.1% of quantum yield) under the illumination of 360 nm light is comparable to that obtained using a C60-based mol. as the electron acceptor (1700 nA/cm<sup>2</sup>). This result demonstrates the feasibility of using anthraquinone-anthrylacetylene-thiol linked mol. as an efficient electron acceptor for constructing a monochromatic light-to-current mol. converter.

AB Bis(2-acenyl)acetylene compds. that are useful as stable and reproducible organic **semiconductors** are disclosed. The compds., when used as the active layer in OTFTs exhibit device characteristics, like charge-carrier mobilities and current on/off ratios, that are comparable to those of pentacene. Also described are **semiconductor** devices comprising at least one compound of the invention; and articles comprising the **semiconductor** devices such as **thin film transistors** or transistor arrays, and electroluminescent lamps.
